## Overview

This document describes the profile of an HVAC temperature sensor object. The profile supports the standard Node Object.

## Temperature Sensor Object Details

The following diagram details the mandatory and optional network variables, as well as the configuration properties for the HVAC temperature sensor functional profile.

**Figure 1.2** HVAC Temperature Functional Profile

## Mandatory Network Variables

### HVAC Temperature Output

network output SNVT\_temp\_p nvoHVACTemp

This output variable reports the temperature of the sensor using the HVAC temperature SNVT.

*Valid Range*

see SNVT\_temp\_p

*Default Value*

None

*Remark*

The actual sensor hardware can be of any type.

---

## Mandatory Configuration Properties

---

### Max Send Time

```
network input config SNVT_time_sec nciMaxSendtime;
```

Indicates the maximum period of time that expires before the sensor object automatically updates all its output variables.

*Valid Range*

see SNVT\_time\_sec

*Default Value*

300 seconds

*SCPT Reference*

SCPTmaxSendTime(49)

---

### Min Send Time

```
network input config SNVT_time_sec nciMinsendtime;
```

Indicates the minimum period between output network variable transitions.

*Valid Range*

see SNVT\_time\_sec

*Default Value*

5 seconds

*SCPT Reference*

SCPTminSendTime (52)

---

### Send on Delta

```
network input config SNVT_temp_p nciMinDelta;
```

Indicates the minimum temperature change required to update the output network network variables.

*Valid Range*

see SNVT\_temp\_p

*Default Value*

.3 degree Celsius

*SCPT Reference*

SCPTminDeltaTemp(64)

---

*Optional Network Variables*

**Fixed Point Temperature Output**

network output SNVT\_temp nvoFixPtTemp

This output variable reports the temperature of the sensor using the Fixed point temperature SNVT.

*Valid Range*

see SNVT\_temp

*Default Value*

None

*Remark*

The actual sensor hardware can be of any type.

---

**Floating Point Temperature Output**

network output SNVT\_temp\_f nvoFloatTemp

This output variable reports the temperature of the sensor using the Floating point temperature SNVT.

*Valid Range*

see SNVT\_temp\_f

*Default Value*

None

*Remark*

The actual sensor hardware can be of any type.

---

*Optional Configuration Properties*

---

**Temperature Offset**

```
network input config SNVT_temp_p nciTmpOffset;
```

This configuration property is used to calibrate the external hardware by specifying the level that the `nvoHVACTemp` output should adopt based on the current data from the hardware. This offset applies after the use of any translation table or gain factor.

### *Valid Range*

The valid range is any value within the defined limits of the `SNVT_temp_p`.

### *Default Value*

The default value is manufacturer specific.

### *SCPT Reference*

`SCPToffsetTemp(70)`

---

## Power-up State

All configuration properties which are stored are recalled during power up. The output variables are set to the temperature of the sensor.
